

## Problem L

### Sending Blessings

There are  $N$  cities connected by  $N$  bridges in the country of Sayagueaing. The cities and the bridges are numbered from 1 to  $N$ . The  $i^{th}$  bridge connects city  $A_i$  and city  $B_i$  and can be passed by a total of  $C_i$  people before the bridge collapses. It is guaranteed that any pair of cities are connected by a sequence of bridges. It is also guaranteed that any pair of cities are directly connected by at most one bridge.

At the start of every year, one of the  $N$  cities wants to send new year blessings to another one of the  $N$  cities. Specifically, we will consider the first  $Q$  years. At the start of the  $i^{th}$  year, city  $U_i$  wants to send new year blessings to city  $V_i$ . To do so, the sender city sends as many residents as possible to the recipient city, one resident at a time. Each resident will go from city  $U_i$  to city  $V_i$  through one or more bridges. The president of Sayagueaing is wondering the number of residents that can reach the recipient city.

Note that at the end of every year, the conditions of the bridges are restored to their original state. In other words, all collapsed bridges will be rebuilt, and the  $i^{th}$  bridge can be passed by a total of  $C_i$  people.

#### Input

Input begins with a line containing two integers:  $N$   $Q$  ( $3 \leq N \leq 100\,000$ ;  $1 \leq Q \leq 100\,000$ ) representing the number of cities in the country of Sayagueaing and the number of years to be considered, respectively. The next  $N$  lines, each contains three integers:  $A_i$   $B_i$   $C_i$  ( $1 \leq A_i, B_i \leq N$ ;  $A_i \neq B_i$ ;  $1 \leq C_i \leq 100\,000$ ) representing the bridges in the country of Sayagueaing. It is guaranteed that any pair of cities are connected by a sequence of bridges. It is also guaranteed that any pair of cities are directly connected by at most one bridge. The next  $Q$  lines, each contains two integers:  $U_i$   $V_i$  ( $1 \leq U_i, V_i \leq N$ ;  $U_i \neq V_i$ ) representing new year blessings to be sent.

#### Output

For each year in the same order as input, output in a line an integer representing the number of residents that can reach the recipient city at the start of the year.

#### Sample Input #1

```
4 3
1 2 10
2 3 2
2 4 3
3 4 1
2 4
1 4
1 2
```

### Sample Output #1

```
4
4
10
```

#### *Explanation for the sample input/output #1*

- At the start of the first year, city 2 can send 3 residents using the direct bridge connecting city 2 and city 4 and 1 more resident via city 3. Thus, a total of 4 residents are sent.
- At the start of the second year, city 1 can send 4 residents via city 2. Similar to the previous year, 3 of the residents will use the direct bridge connecting city 2 and city 4.
- At the start of the third year, city 1 can send 10 residents using the direct bridge connecting city 1 and city 2.
